<b>States = 11</b>		<b>Cities = 55</b>		<b>Location / AAQ Station =129</b>	<b>Observation*/ AQI* numbers= 1070</b>

**Note:** - \*-One observation means one AQI Calculated for daily ambient air quality data at one station. Several AQI are obtained from one station for several days.

## National Air Quality Index

<b>AQI</b>	<b>Possible Health impacts</b>
<b>Good (0–50)</b>	Minimal Impact
<b>Satisfactory (51–100)</b>	Minor breathing discomfort to sensitive people
<b>Moderate (101–200)</b>	Breathing discomfort to the people with lung, heart disease, children and older adults
<b>Poor (201–300)</b>	Breathing discomfort to people on prolonged exposure
<b>Very Poor (301–400)</b>	Respiratory illness to the people on prolonged exposure
<b>Severe (&gt;400)</b>	Respiratory effects even on healthy people

## ***National Air Quality Index for 55 cities at 129 locations of India, February 2016***

### ***Monthly Bulletin of Ambient Air Quality through Manual monitoring system***

Air Quality Index is a tool for effective communication of air quality status to people in terms, which are easy to understand. It transforms complex air quality data of various pollutants into a single number (index value), nomenclature and colour. There are six AQI categories, namely Good, Satisfactory, Moderately polluted, Poor, Very Poor, and Severe. Each of these categories is decided based on ambient concentration values of air pollutants and their likely health impacts (known as health breakpoints). AQ sub-index and health breakpoints are evolved for eight pollutants (PM10, PM2.5, NO2, SO2, CO, O3, NH3, and Pb) for which short-term (upto 24-hours) National Ambient Air Quality Standards are prescribed. Based on the measured ambient concentrations of a pollutant, sub-index is calculated, which is a linear function of concentration (e.g. the sub-index for PM2.5 will be 51 at concentration 31  $\mu\text{g}/\text{m}^3$ , 100 at concentration 60  $\mu\text{g}/\text{m}^3$  and 75 at concentration of 45  $\mu\text{g}/\text{m}^3$ ). The worst sub-index determines the overall AQI.

### ***Cities in different categories of AQI for the month of February:***

Of the total 55 cities covered for calculation of AQI during February 2016, 26 cities revealed good air quality, 43 cities revealed satisfactory air quality, 29 cities revealed moderate air quality, 10 cities indicate poor air quality, 03 cities showed very poor air quality, 01 city (Hyderabad) showed severe air quality.

### ***National Network:***

At present, continuous air quality monitoring stations from 23 cities are connected to the web-based system. Efforts are being made to connect more cities, where continuous monitoring systems are operated by various State Pollution Control Boards (SPCBs). It is planned to strengthen the network of monitoring systems in all 46 cities having population more than a million and 20 State Capitals, and networking them to the central AQI portal, in phased manner. With regard to manual stations in the million plus cities (46 cities), SPCBs have been advised to use AQI calculator and publicize it with minimum time lag, as required for laboratory analysis. Central Pollution Control Board has initiated **National Air Quality Monitoring Programme (NAMP; manual monitoring system)** in the year 1984. Under NAMP, three air pollutants viz., Sulphur Dioxide (SO<sub>2</sub>), Nitrogen Dioxide (NO<sub>2</sub>) and Particulate Matter size equal to or less than 10 micron (PM10), have been identified for regular monitoring at all the locations. The NAMP network presently comprises 614 operating monitoring stations located in 254 cities/towns in 29 states and 5 union territories across the country. National AQI bulletin was calculated for the month of February 2016 for 11 states covering 55 cities at 129 locations / ambient air quality monitoring stations with 1070 AQI values. The status of the cities with respect to AQI during February 2016 is summarized below.

### ***Overall AQI category-wise observation:***

Of the total cities covered (55 cities), 19% of AQI value i.e. 206 AQI values in the country out of total 1070 AQI values revealed good air quality and 42 % of AQI value i.e. 449 AQI values in the country showed satisfactory air quality where the predominant pollutant during those days was PM10. Further, the data showed that 32 % of AQI value i.e. 343 AQI values in the country out of total 1070 AQI values showed moderate air quality where the predominant pollutant during those days was PM10 and 6% of AQI value i.e. 66 AQI values in the country out of total 1070 AQI values showed poor air quality where the predominant pollutant during those days was PM10. Of the total cities covered (55 cities), 0.5 % of AQI value i.e. 5 AQI values showed very poor air quality, 0.1 % of AQI value i.e. 1 AQI values in the country of total 1070 AQI values showed severe air quality where the predominant pollutant during those days was PM10.

### *Air Quality Index for the 55 cities during February 2016*

AQI category	AQI	Color Code	Number of AQI values in different category		Pollutant-wise number of AQI values in AQI category			Possible Health Impacts
			No of AQI values	% of AQI values	PM10	PM2.5	NO2	
					No of AQI values	No of AQI values	No of AQI values	
Good	0-50		206	19	202	2	2	Minimal impact
Satisfactory	51-100		449	42	398	49	2	Minor breathing discomfort to sensitive people
Moderate	101-200		343	32	311	32	0	Breathing discomfort to the people with lungs, asthma and heart diseases
Poor	201-300		66	6	64	2	0	Breathing discomfort to most people on prolonged exposure
Very poor	301-400		5	0.5	5	0	0	Respiratory illness on prolonged exposure
Severe	401-500		1	0.1	1	0	0	Affects healthy people and seriously impacts those with existing diseases
<b>Total AQI values</b>			<b>1070</b>	<b>100</b>	<b>981</b>	<b>85</b>	<b>4</b>	

Note: AQI calculated from 24 hourly data of a particular location.

#### ***Overall summary of possible health impacts:***

The analysis of AQI values precisely indicating that 655 AQI values are falling in first two categories (good and satisfactory) of national AQI. A total of 61% of AQI values fall in good and satisfactory categories which indicates that the people in these areas suffer either minimal impact of the concentration of the pollutants or minor breathing discomfort for the sensitive people. The analysis of AQI values further expressing that 409 AQI values are falling in second two categories (moderate and poor) of national AQI. A total of 38% of AQI values fall in moderate and poor categories which indicates that the people in these areas may suffer from breathing discomfort to the people with lungs, asthma and heart diseases or to most people on prolonged exposure. The analysis of AQI values indicating that 6 AQI values are falling in third two categories (very poor and Severe) of national AQI. A total of 0.6% of AQI values fall in very poor and Severe categories which indicates that the people in these areas may suffer from respiratory illness on prolonged exposure. It is pertinent to mention that impact of pollutants or air quality depends on the changes in lower atmospheric stability of the area and daily calculated index/sub-index of various pollutants along with period of exposure of pollutants to human being and the immunity status of the individuals.

#### ***Broad guidelines by Central Pollution Control Board for Public/Citizens of India***

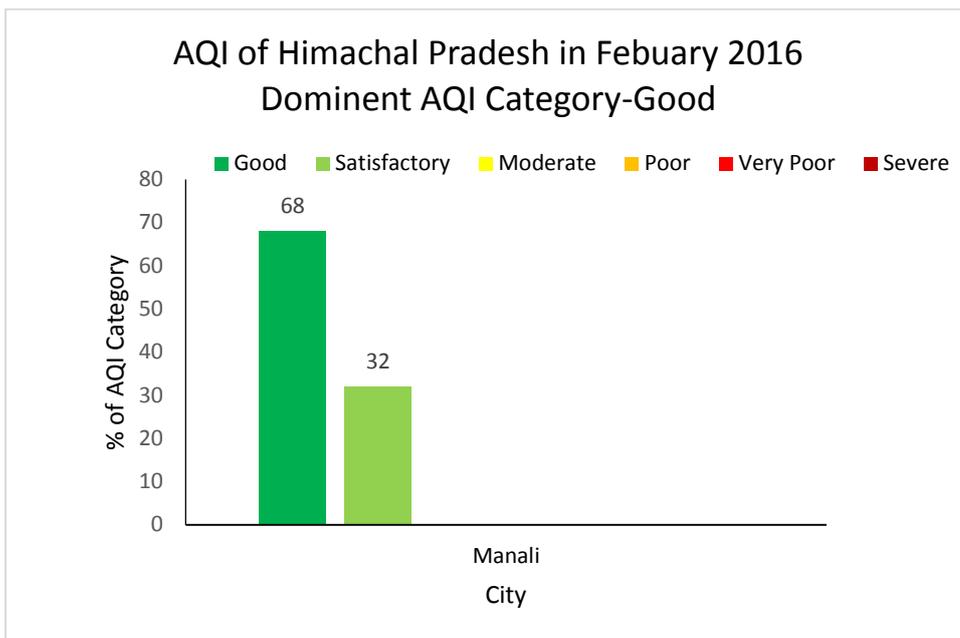

AQI is an initiative intended to enhance public awareness and involvement in efforts to improve air quality. People can contribute by maintaining vehicles properly (e.g. get PUC checks, replace car air filter, maintain right tyre pressure), following lane discipline & speed limits, avoiding prolong idling and turning off engines at red traffic signals. In addition to above, during severe or very poor AQI, people should minimize travel; avoid using private vehicles and instead use public transport, bikes or walk, and carpool; use smaller vehicles (e.g. avoid SUVs).
