# Introduction

Air Quality Index in addition to land and water, air is the prime resource for sustenance of life. With the technological advancements, a vast amount of data on ambient air quality is generated and used to establish the quality of air in different areas. The large monitoring data result in encyclopedic volumes of information that neither gives a clear picture to a decision maker nor to a common man who simply wants to know how good or bad the air is? One way to describe air quality is to report the concentrations of all pollutants with acceptable levels (standards). As the number of sampling stations and pollution parameters (and their sampling frequencies) increase, such descriptions of air quality tend to become confusing even for the scientific and technical community.

As for the general public, they usually will not be satisfied with raw data, time series plots, statistical analyses, and other complex findings pertaining to air quality. The result is that people tend to lose interest and can neither appreciate the state of air quality nor the pollution mitigation efforts by regulatory agencies. Since awareness of daily levels of urban air pollution is important to those who suffer from illnesses caused by exposure to air pollution, the issue of air quality communication should be addressed in an effective manner. Further, the success of a nation to improve air quality depends on the support of its citizens who are well-informed about local and national air pollution problems and about the progress of mitigation efforts.

## About National Air Quality Index

Air Quality Index is a tool for effective communication of air quality status to people in terms, which are easy to understand. It transforms complex air quality data of various pollutants into a single number (index value), nomenclature and color.

There are six AQI categories, namely Good, Satisfactory, Moderately polluted, Poor, Very Poor, and Severe. Each of these categories is decided based on ambient concentration values of air pollutants and their likely health impacts (known as health breakpoints). AQ sub-index and health breakpoints are evolved for eight pollutants (PM<sub>10</sub>, PM<sub>2.5</sub>, NO<sub>2</sub>, SO<sub>2</sub>, CO, O<sub>3</sub>, NH<sub>3</sub>, and Pb) for which short-term (upto 24-hours) National Ambient Air Quality Standards are prescribed.

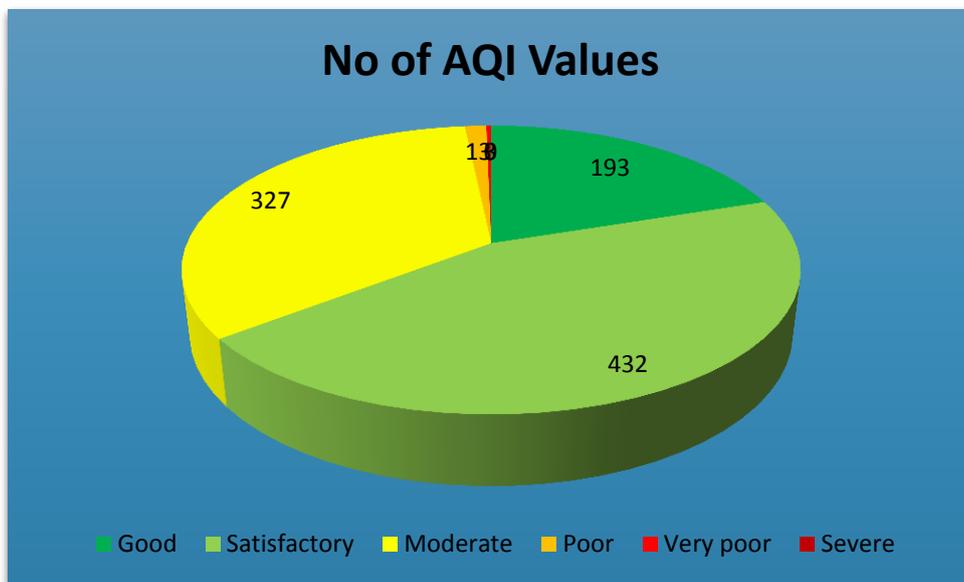

Based on the measured ambient concentrations of a pollutant, sub-index is calculated, which is a linear function of concentration (e.g. the sub-index for PM<sub>2.5</sub> will be 51 at concentration 31 µg/m<sup>3</sup>, 100 at concentration 60 µg/m<sup>3</sup>, and 75 at concentration of 45 µg/m<sup>3</sup>). The worst sub-index determines the overall AQI. AQI categories and health breakpoints for the eight pollutants are as follow:

AQI Category	AQI	Concentration range*							
		PM <sub>10</sub>	PM <sub>2.5</sub>	NO <sub>2</sub>	O <sub>3</sub>	CO	SO <sub>2</sub>	NH <sub>3</sub>	Pb
Good	0-50	0-50	0-30	0-40	0-50	0-1.0	0-40	0-200	0-0.5
Satisfactory	51-100	51-100	31-60	41-80	51-100	1.1-2.0	41-80	201-400	0.5-1.0
Moderate	101-200	101-250	61-90	81-180	101-168	2.1-10	81-380	401-800	1.1-2.0
Poor	201-300	251-350	91-120	181-280	169-208	10-17	381-800	801-1200	2.1-3.0
Very-Poor	301-400	351-430	121-250	281-400	209-748*	17-34	801-1600	1200-1800	3.1-3.5
Severe	401-500	430+	250+	400+	748+*	34+	1600+	1800+	3.5+

\* CO in mg/m<sup>3</sup> and other pollutants in µg/m<sup>3</sup>; 2h-hourly average values for PM<sub>10</sub>, PM<sub>2.5</sub>, NO<sub>2</sub>, SO<sub>2</sub>, NH<sub>3</sub>, and Pb, and 8-hourly values for CO and O<sub>3</sub>.

## Air Quality Index for the 60 cities during September 2016

AQI category	AQI	Colour Code	Number of AQI values in different category	
			No of AQI values	% of AQI values
Good	0-50		193	19.9
Satisfactory	51-100		432	44.6
Moderate	101-200		327	33.8
Poor	201-300		13	1.3
Very poor	301-400		3	0.3
Severe	401-500		0	0.0
<b>Total AQI values</b>			<b>968</b>	<b>100</b>

## How is AQI calculated?

The Sub-indices for individual pollutants at a monitoring location are calculated using its 24-hourly average concentration value (8-hourly in case of CO and O3) and health breakpoint concentration range. The worst sub-index is the AQI for that location.

All the eight pollutants may not be monitored at all the locations. Overall AQI is calculated only if data are available for minimum three pollutants out of which one should necessarily be either PM2.5 or PM10. Else, data are considered insufficient for calculating AQI. Similarly, a minimum of 16 hours' data is considered necessary for calculating sub index.

The sub-indices for monitored pollutants are calculated and disseminated, even if data are inadequate for determining AQI. The Individual pollutant-wise sub-index will provide air quality status for that pollutant.

The web-based system is designed to provide AQI on real time basis. It is an automated system that captures data from continuous monitoring stations without human intervention, and displays AQI based on running average values (e.g. AQI at 6am on a day will incorporate data from 6am on previous day to the current day). 5. For manual monitoring stations, an AQI calculator is developed wherein data can be fed manually to get AQI value.

Calculation of AQI						
<b>Date</b> DD-MM-YYYY			<b>Station</b> City State	Delhi Delhi	NSIT	
<b>Pollutants</b>		<b>concentration in <math>\mu\text{g}/\text{m}^3</math> (except for CO)</b>	<b>Sub-Index</b>			<b>Air Quality Index</b>
PM10	24-hr avg	121.00	114	check		<div style="border: 2px solid black; background-color: yellow; width: 100px; height: 100px; display: flex; align-items: center; justify-content: center; margin: 0 auto;"> <b>114</b> </div>
PM2.5	24-hr avg	34.00	57	1		
SO2	24-hr avg	0.00	0	0		
NOx	24-hr avg	8.00	10	1		
*CO (mg/m3)	max 8-hr	0.00	0	0		
O3	max 8-hr	57.00	57	1		
NH3	24-hr avg	34.00	9	1		
<small>* Concentrations of minimum three pollutants are required; one of them should be PM10 or PM2.5            * The check displays "1" when a non-zero value is entered</small>						
<b>Good (0-50)</b>	Minimal Impact			<b>Poor (201-300)</b>	Breathing discomfort to people on prolonged exposure	
<b>Satisfactory (51-100)</b>	Minor breathing discomfort to sensitive people			<b>Very Poor (301-400)</b>	Respiratory illness to the people on prolonged exposure	
<b>Moderate (101-200)</b>	Breathing discomfort to the people with lung, heart disease, children and older adults			<b>Severe (&gt;401)</b>	Respiratory effects even on healthy people	

**Revised National Ambient Air Quality Standards (NAAQS)**  
[NAAQS Notification dated 18<sup>th</sup> November, 2009]

S. No.	Pollutants	Time Weighted Average	Concentration in Ambient Air		Methods of Measurement
			Industrial, Residential, Rural and other Areas	Ecologically Sensitive Area (notified by Central Government)	
1	Sulphur Dioxide (SO <sub>2</sub> ), µg/m <sup>3</sup>	Annual*	50	20	1. Improved West and Gaeke 2. Ultraviolet Fluorescence
		24 Hours**	80	80	
2	Nitrogen Dioxide (NO <sub>2</sub> ), µg/m <sup>3</sup>	Annual*	40	30	1. Modified Jacob & Hochheiser 2. Chemiluminescence
		24 Hours**	80	80	
3	Particulate Matter (Size <10µm) or PM <sub>10</sub> µg/m <sup>3</sup>	Annual*	60	60	1. Gravimetric 2. TEOM 3. Beta attenuation
		24 Hours**	100	100	
4	Particulate Matter (Size <2.5 µm) or PM <sub>2.5</sub> µg/m <sup>3</sup>	Annual*	40	40	1. Gravimetric 2. TEOM 3. Beta attenuation
		24 Hours**	60	60	
5	Ozone (O <sub>3</sub> ), µg/m <sup>3</sup>	8 hours**	100	100	1. UV photometric 2. Chemiluminescence 3. Chemical Method
		1 hours**	180	180	
6	Lead (Pb), µg/m <sup>3</sup>	Annual*	0.50	0.50	1. AAS/ICP Method after sampling using EPM 2000 or equivalent filter paper 2. ED-XRF using Teflon filter
		24 Hour**	1.0	1.0

<b>States = 12</b>		<b>Cities = 60</b>		<b>Location / AAQ Station = 119</b>	<b>Observation* / AQI* numbers= 968</b>

**Note:** - \*-One observation means one AQI Calculated for daily ambient air quality data at one station. Several AQI are obtained from one station for several days.

## National Air Quality Index

<b>AQI</b>	<b>Possible Health impacts</b>
<b>Good (0–50)</b>	Minimal Impact
<b>Satisfactory (51–100)</b>	Minor breathing discomfort to sensitive people
<b>Moderate (101–200)</b>	Breathing discomfort to the people with lung, heart disease, children and older adults
<b>Poor (201–300)</b>	Breathing discomfort to people on prolonged exposure
<b>Very Poor (301–400)</b>	Respiratory illness to the people on prolonged exposure
<b>Severe (&gt;400)</b>	Respiratory effects even on healthy people

## ***National Air Quality Index for 60 cities at 119 locations of India, September 2016***

### ***Monthly Bulletin of Ambient Air Quality through Manual monitoring system***

Air Quality Index is a tool for effective communication of air quality status to people in terms, which are easy to understand. It transforms complex air quality data of various pollutants into a single number (index value), nomenclature and colour. There are six AQI categories, namely Good, Satisfactory, Moderately polluted, Poor, Very Poor, and Severe. Each of these categories is decided based on ambient concentration values of air pollutants and their likely health impacts (known as health breakpoints). AQ sub-index and health breakpoints are evolved for eight pollutants (PM<sub>10</sub>, PM<sub>2.5</sub>, NO<sub>2</sub>, SO<sub>2</sub>, CO, O<sub>3</sub>, NH<sub>3</sub>, and Pb) for which short-term (upto 24-hours) National Ambient Air Quality Standards are prescribed. Based on the measured ambient concentrations of a pollutant, sub-index is calculated, which is a linear function of concentration (e.g. the sub-index for PM<sub>2.5</sub> will be 51 at concentration 31 µg/m<sup>3</sup>, 100 at concentration 60 µg/m<sup>3</sup> and 75 at concentration of 45 µg/m<sup>3</sup>). The worst sub-index determines the overall AQI.

### ***Cities in different categories of AQI for the month of September:***

Of the total 60 cities covered for calculation of AQI during September 2016, 27 cities revealed good air quality with 193 no of observation/AQI falling in this category, 38 cities revealed satisfactory air quality with 432 no of observation/AQI falling in this category, 26 cities revealed moderate air quality with 327 no of observation/AQI falling in this category, 3 cities indicate poor air quality with 13 no of observation/AQI falling in this category, 1 cities showed very poor air quality with 3 no of observation/AQI falling in this category, there is no cities showed severe air quality.

Note:- a particular city may fall in one category for no of days with the same city fall in other categories for other days in the months.

### ***National Network:***

At present, continuous air quality monitoring stations from 24 cities are connected to the web-based system. Efforts are being made to connect more cities, where continuous monitoring systems are operated by various State Pollution Control Boards (SPCBs). It is planned to strengthen the network of monitoring systems in all 46 cities having population more than a million and 20 State Capitals, and networking them to the central AQI portal, in phased manner. With regard to manual stations in the million plus cities (46 cities), SPCBs have been advised to use AQI calculator and publicize it with minimum time lag, as required for laboratory analysis. Central Pollution Control Board has initiated **National Air Quality Monitoring Programme (NAMP; manual monitoring system)** in the year 1984. Under NAMP, three air pollutants viz., Sulphur Dioxide (SO<sub>2</sub>), Nitrogen Dioxide (NO<sub>2</sub>) and Particulate Matter size equal to or less than 10 micron (PM<sub>10</sub>), have been identified for regular monitoring at all the locations. The NAMP network presently comprises 621 operating monitoring stations located in 262 cities/towns in 29 states and 5 union territories across the country. National AQI bulletin was calculated for the month of September 2016 for 12 states covering 60 cities at 119 locations / ambient air quality monitoring stations with 968 AQI values. The status of the cities with respect to AQI during September 2016 is summarized below.

### ***Overall AQI category-wise observation:***

Of the total cities covered (60 cities), 19.9% of AQI value i.e. 193 AQI values in the country out of total 968 AQI values revealed good air quality and 44.6 % of AQI value i.e. 432 AQI values in the country showed satisfactory air quality where the predominant pollutant during those days was PM<sub>10</sub> and PM<sub>2.5</sub>. Further, the data showed that 33.8 % of AQI value i.e. 327 AQI values in the country out of total 968 AQI values showed moderate air quality where the predominant pollutant during those days was PM<sub>10</sub> and PM<sub>2.5</sub>. further the data showed that 1.3% of AQI value i.e. 13 AQI values in the country out of total 968 AQI values showed poor air quality where the predominant pollutant during those days was PM<sub>10</sub> and PM<sub>2.5</sub>. Of the total cities covered (60 cities), 0.3 % of AQI value i.e. 3 AQI values in the country of total 968 AQI values showed very poor air quality where the predominant pollutant during those days was PM<sub>10</sub>.

### *Air Quality Index for the 60 cities during September 2016*

AQI category	AQI	Colour Code	Number of AQI values in different category		Pollutant-wise number of AQI values in AQI category			Possible Health Impacts
			No of AQI values	% of AQI values	PM10	PM2.5	NO2	
					No of AQI values	No of AQI values	No of AQI values	
Good	0-50		193	19.9	190	1	2	Minimal impact
Satisfactory	51-100		432	44.6	423	9	0	Minor breathing discomfort to sensitive people
Moderate	101-200		327	33.8	325	2	0	Breathing discomfort to the people with lungs, asthma and heart diseases
Poor	201-300		13	1.3	11	2	0	Breathing discomfort to most people on prolonged exposure
Very poor	301-400		3	0.3	2	1	0	Respiratory illness on prolonged exposure
Severe	401-500		0	0.0	0	0	0	Affects healthy people and seriously impacts those with existing diseases
<b>Total AQI values</b>			<b>968</b>	<b>100</b>	<b>951</b>	<b>15</b>	<b>2</b>	

Note: AQI calculated from 24 hourly data of a particular location.

#### ***Overall summary of possible health impacts:***

The analysis of AQI values precisely indicating that 625 AQI values are falling in first two categories (good and satisfactory) of national AQI. A total of 64.6% of AQI values fall in good and satisfactory categories which indicates that the people in these areas suffer either minimal impact of the concentration of the pollutants or minor breathing discomfort for the sensitive people. The analysis of AQI values further expressing that 340 AQI values are falling in second two categories (moderate and poor) of national AQI. A total of 35.1% of AQI values fall in moderate and poor categories which indicates that the people in these areas may suffer from breathing discomfort to the people with lungs, asthma and heart diseases or to most people on prolonged exposure. The analysis of AQI values indicating that 3 AQI values are falling in third two categories (very poor and severe) of national AQI. A total of 0.3% of AQI values fall in very poor and severe categories which indicates that the people in these areas may suffer from respiratory illness on prolonged exposure Affects healthy people and seriously impacts those with existing diseases. It is pertinent to mention that impact of pollutants or air quality depends on the changes in lower atmospheric stability of the area and daily calculated index/sub-index of various pollutants along with period of exposure of pollutants to human being and the immunity status of the individuals.

#### ***Broad guidelines by Central Pollution Control Board for Public/Citizens of India***

AQI is an initiative intended to enhance public awareness and involvement in efforts to improve air quality. People can contribute by maintaining vehicles properly (e.g. get PUC checks, replace car air filter, maintain right tyre pressure), following lane discipline & speed limits, avoiding prolong idling and turning off engines at red traffic signals. In addition to above, during severe or very poor AQI, people should minimize travel; avoid using private vehicles and instead use public transport, bikes or walk, and carpool; use smaller vehicles (e.g. avoid SUVs).
