States = 17		Cities = 85		Location / AAQ Station = 168	Observation*/ AQI* numbers= 1438

Note: - *-One observation means one AQI Calculated for daily ambient air quality data at one station. Several AQI are obtained from one station for several days.

National Air Quality Index

AQI	Possible Health impacts
Good (0–50)	Minimal Impact
Satisfactory (51–100)	Minor breathing discomfort to sensitive people
Moderate (101–200)	Breathing discomfort to the people with lung, heart disease, children and older adults
Poor (201–300)	Breathing discomfort to people on prolonged exposure
Very Poor (301–400)	Respiratory illness to the people on prolonged exposure
Severe (>400)	Respiratory effects even on healthy people

National Air Quality Index for 85 cities at 168 locations of India, October 2015

Monthly Bulletin of Ambient Air Quality through Manual monitoring system

Air Quality Index is a tool for effective communication of air quality status to people in terms, which are easy to understand. It transforms complex air quality data of various pollutants into a single number (index value), nomenclature and colour. There are six AQI categories, namely Good, Satisfactory, Moderately polluted, Poor, Very Poor, and Severe. Each of these categories is decided based on ambient concentration values of air pollutants and their likely health impacts (known as health breakpoints). AQ sub-index and health breakpoints are evolved for eight pollutants (PM10, PM2.5, NO2, SO2, CO, O3, NH3, and Pb) for which short-term (upto 24-hours) National Ambient Air Quality Standards are prescribed. Based on the measured ambient concentrations of a pollutant, sub-index is calculated, which is a linear function of concentration (e.g. the sub-index for PM2.5 will be 51 at concentration 31 $\mu\text{g}/\text{m}^3$, 100 at concentration 60 $\mu\text{g}/\text{m}^3$ and 75 at concentration of 45 $\mu\text{g}/\text{m}^3$). The worst sub-index determines the overall AQI.

Cities in different categories of AQI for the month of October:

Of the total 85 cities covered for calculation of AQI during October 2015, 48 cities revealed good air quality, 62 cities revealed satisfactory air quality, 33 cities revealed moderate air quality, 8 cities indicate poor air quality, 3 cities (Delhi, Devangere, Karnataka and Lucknow, Uttar Pradesh) cities showed very poor air quality and 2 city (Delhi, Lucknow-Uttar Pradesh) showed severe air quality.

National Network:

At present, continuous air quality monitoring stations from 14 cities are connected to the web-based system. Efforts are being made to connect more cities, where continuous monitoring systems are operated by various State Pollution Control Boards (SPCBs). It is planned to strengthen the network of monitoring systems in all 46 cities having population more than a million and 20 State Capitals, and networking them to the central AQI portal, in phased manner. With regard to manual stations in the million plus cities (46 cities), SPCBs have been advised to use AQI calculator and publicize it with minimum time lag, as required for laboratory analysis. Central Pollution Control Board has initiated **National Air Quality Monitoring Programme (NAMP; manual monitoring system)** in the year 1984. Under NAMP, three air pollutants viz., Sulphur Dioxide (SO₂), Nitrogen Dioxide (NO₂) and Particulate Matter size equal to or less than 10 micron (PM₁₀), have been identified for regular monitoring at all the locations. The NAMP network presently comprises 612 operating monitoring stations located in 254 cities/towns in 29 states and 5 union territories (as on 31.12.2015) across the country. National AQI bulletin was calculated for the month of October 2015 for 17 states covering 85 cities at 168 locations / ambient air quality monitoring stations with 1438 AQI values. The status of the cities with respect to AQI during October 2015 is summarized below.

Overall AQI category-wise observation:

Of the total cities covered (85 cities), 30% of AQI value i.e. 435 AQI values in the country out of total 1438 AQI values revealed good air quality and 40 % of AQI value i.e. 570 AQI values in the country showed satisfactory air quality where the predominant pollutant during those days was PM₁₀. Further, the data showed that 25 % of AQI value i.e. 366 AQI values in the country out of total 1438 AQI values showed moderate air quality where the predominant pollutant during those days was PM₁₀ and 4% of AQI value i.e. 51 AQI values in the country out of total 1438 AQI values showed poor air quality where the predominant pollutant during those days was PM₁₀. Of the total cities covered (85 cities), 0.90 % of AQI value i.e. 13 AQI values in the country of total 1438 AQI values showed very poor air quality where the predominant pollutant during those days was PM₁₀ and 0.21 % of AQI value i.e. 3 AQI values in the country of total 1438 AQI values showed severe air quality where the predominant pollutant during those days was PM₁₀.

Air Quality Index for the 86 cities during September 2015

AQI category	AQI	Colour Code	Number of AQI values in different category		Pollutant-wise number of AQI values in AQI category					Possible Health Impacts
			No of AQI values	% of AQI values	No of AQI values					
					SO2	PM10	PM2.5	PM10 + PM2.5	NO2	
Good	0-50		435	30	3	418	5	0	9	Minimal impact
Satisfactory	51-100		570	40	0	557	13	0	0	Minor breathing discomfort to sensitive people
Moderate	101-200		366	25	0	343	13	10	0	Breathing discomfort to the people with lungs, asthma and heart diseases
Poor	201-300		51	4	0	39	3	9	0	Breathing discomfort to most people on prolonged exposure
Very poor	301-400		13	0.90	0	2	0	11	0	Respiratory illness on prolonged exposure
Severe	401-500		3	0.21	0	1	0	2	0	Affects healthy people and seriously impacts those with existing diseases
Total AQI values			1438	100	3	1360	34	32	9	

Note: AQI calculated from 24 hourly data of a particular location.

Overall summary of possible health impacts:

The analysis of AQI values precisely indicating that 1005 AQI values are falling in first two categories (good and satisfactory) of national AQI. A total of 70% of AQI values fall in good and satisfactory categories which indicates that the people in these areas suffer either minimal impact of the concentration of the pollutants or minor breathing discomfort for the sensitive people. The analysis of AQI values further expressing that 417 AQI values are falling in second two categories (moderate and poor) of national AQI. A total of 29% of AQI values fall in moderate and poor categories which indicates that the people in these areas may suffer from breathing discomfort to the people with lungs, asthma and heart diseases or to most people on prolonged exposure. The analysis of AQI values indicating that 16 AQI values are falling in third categories (very poor) of national AQI. A total of 01% of AQI values fall in very poor categories which indicates that the people in these areas may suffer from respiratory illness on prolonged exposure. It is pertinent to mention that impact of pollutants or air quality depends on the changes in lower atmospheric stability of the area and daily calculated index/sub-index of various pollutants along with period of exposure of pollutants to human being and the immunity status of the individuals.

Broad guidelines by Central Pollution Control Board for Public/Citizens of India

AQI is an initiative intended to enhance public awareness and involvement in efforts to improve air quality. People can contribute by maintaining vehicles properly (e.g. get PUC checks, replace car air filter, maintain right tyre pressure), following lane discipline & speed limits, avoiding prolong idling and turning off engines at red traffic signals. In addition to above, during severe or very poor AQI, people should minimize travel; avoid using private vehicles and instead use public transport, bikes or walk, and carpool; use smaller vehicles (e.g. avoid SUVs).
